of: ic stroboscopy ryngeal imaging Il injections atments rd augmentation yngoscopy afting ch surgery nor resection	Anesthesia: MAC Time: 1 hour 1½ hours 2 hours Alternatives: might include speech therapy or no treatment. Risks: Anesthesia risk, suboptimal result The procedure laryngoplasty to augment or correct a vocal weakness consists of passing a flexible scope through the nose to monitor the voice box and the surgical opening up the voicebox (thyroid cartilage). Medialization involves inserting an implant (most often Gore-Tex or Silastic) through an opening in the cartilage. Arytenoid adduction involves suturing one of the cartilages of the vocal cords. Nerve transfer involves borrowing a nerve from a neck muscle and attaching it to one of the nerves to the vocal cords. The main risks of surgery include, but are not limited to a reaction to anesthesia, which is uncommon but can be life threatening. The procedure could potentially cause swelling of the vocal folds. Bleeding or infection at possible anytime an incision is placed into the skin. Results with surgery cannot be guaranteed and a suboptimal result is possible. There is an extensive explanation of the procedure available in print from the office.
